

Remark: Sampling validity - fresh $\text{chol}(\Sigma_r)$ vs. sub-block of L ($\mathcal{I}=\{0,2\}$, removed $=\{1\}$)

Correct: $\mathbf{p}_{\mathcal{I}} = \mathbf{p}_{o,\mathcal{I}} + L_r \mathbf{z}_r$
where $L_r = \text{chol}(\Sigma_r)$

Incorrect: $\mathbf{p}_{\mathcal{I}} = \mathbf{p}_{o,\mathcal{I}} + L_{\mathcal{I}} \mathbf{z}_r$
where $L_{\mathcal{I}}$ = sub-block of L ($\mathcal{I}=\{0,2\}$)

Sub-block $L_{\mathcal{I}}$ misses column 1 of L : $\Sigma_r[2,2] = L_{20}^2 + L_{21}^2 + L_{22}^2$, but $L_{\mathcal{I}} L_{\mathcal{I}}^T[1,1] = L_{20}^2 + L_{22}^2$ (underestimates p_3 variance by L_{21}^2)
